Probability and Distributions

Section 1 - probability and distributions
Let X be a continuous random variable with pdf $f_X(x)$ and support S_X . Let $Y = g(X)$, where $g(x)$ is a one-to-one differentiable function, on the support of X , S_X . Then the pdf of Y is given by $f_Y(y) = f_X(g^{-1}(y))|\frac{dx}{dy}|$ for $y \in S_Y$ where the support of Y is the set $S_Y = \{y = g(x) : x \in S_X\}$.
If X and Y are independent random variables, then $M_{X+Y}(t) = M_X(t)M_Y(t)$.
If X and Y are independent random variables, then $\rho(X, Y) = 0$.
If X is a discrete random variable, then mgf of X is $M_X(t) = \sum P(X = k)e^{kt}$.
If $X \sim \text{Gamma}(a_1, b)$ and $Y \sim \text{Gamma}(a_2, b)$, $X + Y \sim \text{Gamma}(a_1 + a_2, b)$ if X and Y are independent.
If $X \sim \text{Gamma}(a_1, b)$, then $cX \sim \text{Gamma}(a_1, cb)$.
 $X \sim \text{Gamma}(a, b)$, if $a = 1$ then $X \sim \text{exponential}(b)$; if $b = 2$ then $X \sim \chi^2_{(2a)}$.
If $X_i \sim \text{Laplace}(\mu, b)$ then $\frac{2\sum_{i=1}^n |X_i - \mu|}{b} \sim \chi^2(2n)$.
If $X \sim \text{Laplace}(0, b)$ then $|X| \sim \text{Exponential}(b^{-1})$.
If $X \sim \text{Exp}(\lambda)$ then $X \sim \text{Gamma}(1, \lambda)$.

Section 2 - Multivariate Distributions
Covariance: $EX = \mu_1, EY = \mu_2, \text{Cov}(X, Y) = E(XY) - \mu_1\mu_2$,
Correlation: $\rho = \frac{\text{cov}(X, Y)}{\sigma_1\sigma_2}$
 $E(X_2) = E[E(X_2|X_1)]$,
 $\text{Var}(X_2) = E[\text{Var}(X_2|X_1)] + \text{Var}(E(X_2|X_1)) \geq \text{Var}(E(X_2|X_1))$.

Statistical Inference

Inequalities - Important Inequalities
Markov's Inequality: $u(X)$ non-negative, $E(u(X))$ exists, $P[u(X) \geq c] \leq \frac{E(u(X))}{c}$.
Chebyshev's Inequality: $P(|X - \mu| \geq k\sigma) \leq \frac{1}{k^2}$

Distributions : Some facts
Sample mean: $\bar{X} = \frac{\sum X_i}{n}$, Sample variance: $S^2 = \frac{\sum X_i^2 - n\bar{X}^2}{n-1}$, $E(S^2) = \sigma^2$;
 $E(\bar{X}) = \mu$, $\text{var}(\bar{X}) = \frac{\sigma^2}{n}$, $\bar{X} \sim N(\mu, \sigma^2/n)$, $\frac{(n-1)S^2}{\sigma^2} \sim \chi^2_{(n-1)}$, \bar{X} & S^2 are indep.;
 $\sum a_i X_i$ and $\sum b_i X_i$ are indep. iff $\sum a_i b_i = 0$;
 $\frac{\sum (X_i - \mu)^2}{\sigma^2} = \frac{(n-1)S^2}{\sigma^2} + \frac{(\bar{X} - \mu)^2}{\sigma^2/n}$

Order Statistics - Order Statistics
 $g_k(y_k) = \frac{n!}{(k-1)!(n-k)!} [F(y_k)]^{k-1} [1 - F(y_k)]^{n-k} f(y_k)$, $a < y_k < b$; 0 elsewhere.

Section 4 - Confidence Interval Estimation
Error types: Type I - reject H_0 while H_0 is true, $P_\theta(X \in R)$; Type II - fail to reject H_0 while H_0 is false.
Level of significance: the probability of making type I error - reject H_0 when H_0 is true.

Power function: $K(\theta) = P_\theta[(X_1, X_2, \dots, X_n) \in C|\theta]$, $\theta \in \omega_1$. In other words, the power of a hypothesis test is the probability of rejecting H_0 when H_a is true.
Level of significance : $\alpha = \max_{\theta \in \omega_0} K(\theta)$

CI for difference in Means: $X_i \stackrel{iid}{\sim} N(\mu_1, \sigma^2)$, $Y_i \stackrel{iid}{\sim} N(\mu_2, \sigma^2)$, where σ^2 is unknown. $S_p^2 = \frac{(n-1)S_1^2 + (m-1)S_2^2}{n+m-2}$, $\frac{(\bar{X} - \bar{Y}) - (\mu_1 - \mu_2)}{\sqrt{S_p^2(\frac{1}{n} + \frac{1}{m})}} \sim T(n+m-2)$.

Section 5 - Consistency and Limiting Distributions
Convergence in Probability: $X_n \xrightarrow{P} X$ if for every $\epsilon > 0$, $\lim_{n \rightarrow \infty} P(|X_n - X| \geq \epsilon) = 0$ or $(\lim_{n \rightarrow \infty} P(|X_n - X| < \epsilon) = 1)$.
Degenerate r.v.: $p(x) = 1$, if $x = a$; $p(x) = 0$, if $x \neq a$ and
 $F(x) = 0$ if $x < a$; $F(x) = 1$ if $x \geq a$. We write $X_b \xrightarrow{P} a$.
Consistency: The statistic T_n is a consistent estimator for θ iff $T_n \xrightarrow{P} \theta$.

Convergence in Distribution: $X_n \xrightarrow{D} X$ iff $\lim_{n \rightarrow \infty} F_n(x) = F(x)$. $F(x)$ is said to be the limiting distribution or asymptotic distribution of X ;
Theorem 5.2.10: Suppose X_n has m.g.f. $M_{X_n}(t)$ that exists for $-h \leq x \leq h$ for all n . Let X has m.g.f. $M(t)$ which exists for $|t| \leq h_1 \leq h$. If $\lim_{n \rightarrow \infty} M_{X_n}(t) = M(t)$ for $|t| \leq h_1$, then $X_n \xrightarrow{D} X$.
m.g.f technique: (1). $\lim_{n \rightarrow \infty} (1 + \frac{b}{n} + \frac{\phi(u)}{n})^{cn} = \lim_{n \rightarrow \infty} (1 + \frac{b}{n})^{cn} = e^{bc}$ where b and c are constants and $\lim_{n \rightarrow \infty} \phi(n) = 0$. (2). $e^x = 1 + x + \frac{x^2}{2} + \dots + \frac{x^m}{m!} + \dots$;
CLT: $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} f(x)$ with mean μ and variance σ^2 , $y_n = \frac{\bar{X} - \mu}{\sigma/\sqrt{n}} \xrightarrow{D} z$, where $z \sim N(0, 1)$.

Section 6 - Maximum Likelihood Estimation
Consistent: If there is a unique solution to the likelihood equation $\frac{\partial}{\partial \theta} L(\theta) = 0$, then $\hat{\theta} \xrightarrow{P} \theta$ ($\hat{\theta}$ is consistent for θ).
Score function: $\frac{\partial \ln(f(x;\theta))}{\partial \theta}$;
Fisher Information: $I(\theta) = \text{var}(\frac{\partial \ln(f(x;\theta))}{\partial \theta}) = -E(\frac{\partial^2 \ln(f(x;\theta))}{\partial \theta^2})$;
Efficient: y is unbiased for θ , y is efficient for θ iff $\text{var}(y) = [nI(\theta)]^{-1}$. In general, $\text{var}(y) \geq [nI(\theta)]^{-1}$ where y is unbiased for θ .
Efficiency: The efficiency of an unbiased estimator is given by the ratio $\frac{RCLB}{\text{var}(\hat{\theta})}$, where $RCLB = [nI(\theta)]^{-1}$.

Relative Efficiency: Relative efficiency of $\hat{\theta}_1$ to $\hat{\theta}_2$ is $\frac{\text{var}(\hat{\theta}_2)}{\text{var}(\hat{\theta}_1)}$.
Theorem 6.1.2: Suppose $\hat{\theta}$ is the MLE of θ and $g(\theta)$ is a function of θ . Then MLE of $g(\theta)$ is $g(\hat{\theta}) = g(\hat{\theta})$.
Theorem 6.2.1 (Rao-Cramer Lower Bound): $X_1, X - 2, \dots, X_n \stackrel{iid}{\sim} f(x; \theta)$ for $\theta \in \Omega$. Let $y = u(X_1, X_2, \dots, X_n)$ be a statistic with mean $E(Y) = k(\theta)$. Then $\text{var}(Y) \geq \frac{[k'(\theta)]^2}{nI(\theta)}$.

MVUE: $\hat{\theta} = u(X_1, X_2, \dots, X_n)$ is a minimum variance unbiased estimator for θ iff $E(\hat{\theta})$ and $\text{var}(\hat{\theta})$ is less than or equal to the variance of every other unbiased estimator.
Theorem: If $\hat{\theta}$ is asymptotically unbiased for θ and $\text{var}(\hat{\theta}) \rightarrow 0$ as $n \rightarrow \infty$, then $\hat{\theta} \xrightarrow{P} \theta$.

Section 7 - Measure of Quality of Estimators
MVUE: $\hat{\theta} = u(X_1, X_2, \dots, X_n)$ is a minimum variance unbiased estimator for θ iff $E(\hat{\theta}) = \theta$ and $\text{var}(\hat{\theta})$ is less than or equal to the variance of every other unbiased estimator. Relative efficiency of MVUE to any other unbiased estimator must be ≥ 1 . MUVE would be consistent if $\text{var}(\hat{\theta}) \rightarrow 0$ as $n \rightarrow \infty$.

Sufficient Statistics: Let X_1, X_2, \dots, X_n be a random sample from $f(x; \theta)$, $y_1 = u(X_1, X_2, \dots, X_n)$ is sufficient for θ iff $\frac{\Pi(f(x_i;\theta))}{g_1(y_1;\theta)} = H(x_1, x_2, \dots, x_n)$ where g_1 is a marginal pdf for y_1 .
Factorization Theorem: $y_1 = u(X_1, X_2, \dots, X_n)$ is sufficient for θ iff $\prod_{i=1}^n f(x_i; \theta) = k_1(u_1(x_1, x_2, \dots, x_n); \theta) k_2(x_1, x_2, \dots, x_n)$ where $k_2(x_1, x_2, \dots, x_n)$ does not depend on θ .

Theorem 7.3.2: $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} f(x; \theta)$. If a sufficient statistic $y_1 = u(X_1, X_2, \dots, X_n)$ for θ exists and if an MLE $\hat{\theta}$ exists uniquely, then $\hat{\theta}$ is a function of y_1 .
Theorem: Suppose $y_1 = u(X_1, X_2, \dots, X_n)$ is a sufficient statistic for θ . Let $z = u(y_1)$ be a 1-to-1 transformation not involving θ . z is also sufficient for θ .
Rao-Blackwell Theorem: (1). $y_1 = u_1(x_1, x_2, \dots, x_n)$ be sufficient for θ ; (2) $y_2 = u_2(x_1, x_2, \dots, x_n)$ be unbiased for θ ; (3). $\phi(y_1) = E(y_2|y_1)$. Then, (1) $\phi(y_1)$ is a statistic; (2) $\phi(y_1)$ is a function of y_1 alone; (3) $\phi(y_1)$ is unbiased for θ ; (4). $\phi(y_1)$ has variance $< \sigma_{y_2}^2$.

Completeness: Suppose $Z \sim h(z; \theta)$, a member of a family of p.d.f's (p.m.f's): $\{h(z; \theta), \theta \in \Omega\}$. If $E(u(z)) = 0, \forall \theta \in \Omega$ implies that $u(z) = 0$ except on a set of points that has probability 0 for each $h(z; \theta), \theta \in \Omega$, then the family $\{h(z; \theta), \theta \in \Omega\}$ is called a complete family of density (mass) functions.
Lehmann and Scheffe (MVUE): Let $Y_1 = u_1(X_1, X_2, \dots, X_n)$ be sufficient for θ and $\{g_1(y_1, \theta) : \theta \in \Omega\}$ be a complete family of densities (or p.m.f's). If there is a function if Y_1 which is unbiased for θ , then this function of Y_1 is the unique MVUE for θ .

Exponential Family: $f(x; \theta) = \exp\{p(\theta)k(x) + \delta(x) + q(x)\}$ where $\delta(x)$ does not depend on θ , $p(\theta)$ is nontrivial continuous, $k'(x) \neq 0$.
 $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} f(x; \theta)$, a regular case of exponential class with $y_1 = \sum k(x_i)$.
Then, (1) $g_1(y_1; \theta) = R(y_1) \exp\{p(\theta)y_1 + nq(\theta)\}$; (2) $E(y_1) = -n \frac{q'(\theta)}{p'(\theta)}$; (3) $\text{var}(y_1) = n \frac{1}{[p'(\theta)]^3} \{p''(\theta)q'(\theta) - q''(\theta)p'(\theta)\}$

Theorem 7.5.2: $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} f(x; \theta)$, a regular case of exponential class with $\Omega = \{\theta : \gamma < \theta < \delta\}$, $y_1 = \sum k(x_i)$ is sufficient for θ and the family $\{g_1(y_1, \theta) : \gamma < \theta < \delta\}$ is complete.
Theorem 7.4.1: X_1, X_2, \dots, X_n , a random sample from $f(x; \theta)$, $y_1 = u_1(X_1, X_2, \dots, X_n)$ complete sufficient for θ and $E(\phi(y_1)) = \alpha(\theta)$, then $\phi(y_1)$ is unique MVUE for $\alpha(\theta)$.

Section 8 Most powerful tests
Neyman-Pearson Theorem: A best c.r. of size α for testing $H_0 : \theta = \theta'$ v.s $H_1 : \theta = \theta''$ (both simple) is such that
(1) $\frac{L(\theta'; x_1, x_2, \dots, x_n)}{L(\theta''; x_1, x_2, \dots, x_n)} \leq k$ for each $(x_1, x_2, \dots, x_n) \in C$
(2) $\frac{L(\theta'; x_1, x_2, \dots, x_n)}{L(\theta''; x_1, x_2, \dots, x_n)} \geq k$ for each $(x_1, x_2, \dots, x_n) \in C^c$
(3) $P((x_1, x_2, \dots, x_n) \in C; H_0) = \alpha$
Uniformly Most Powerful Test: C is a uniformly most powerful critical region of size α if C is a best critical region of size α for testing H_0 against each simple hypothesis in H_1 .

Likelihood Ratio Test: $\Lambda = \frac{L(\hat{\omega})}{L(\hat{\Omega})} = \frac{\max_{\theta \in \Theta_0} L(\theta)}{\max_{\theta \in \Theta} L(\theta)}$
Neyman-Pearson Lamma: If a critical value is chosen so that $P_{\theta_0}(\Lambda \leq c) = \alpha$, then the test with decision rule

Reject $\theta = \theta_0$ in favor of $\theta = \theta_1$ when $\Lambda \leq c$

is a uniformly most powerful test of size α .
